Fragile Democracies Under Strain: Political Unrest and Economic Breakdown — A Comparative Analysis of South Sudan, Nepal, Sri Lanka, Haiti, and Sudan

Bec George Anyak*

Department of Economics, University of Juba, Juba, South Sudan

Abstract

Fragile democracies are increasingly threatened by the intertwined forces of political unrest and economic deterioration, a pattern evident across South Sudan and comparable contexts in Nepal, Sri Lanka, Haiti, and Sudan. These state-nations exhibit weak institutions, pervasive corruption, and an over-reliance on narrow revenue streams, which collectively undermine democratic legitimacy. To investigate these dynamics, this study employed a comparative qualitative case study design, analyzing secondary data from peer-reviewed literature and institutional reports published between 2020 and 2025. The analysis focused on tracing how economic dependency, public debt, conflict spillovers, and climate shocks interacted with governance failures to fuel unrest and weaken democratic structures. The results showed a consistent feedback loop where economic crises triggered mass protests, which in turn deepened economic contraction and eroded political trust. The findings from the case studies provide concrete evidence of this cycle. In South Sudan, an extreme dependence on oil revenues (>90% of government income) was found to have a strong positive correlation (r=0.82) with political instability. The Sri Lankan crisis demonstrated how unsustainable public debt (>100% of GDP) and soaring inflation (61%) could directly fuel a powerful protest movement. A comparison of Nepal and Haiti revealed distinct but related pathways: Nepal's democratic strain was linked to a youth unemployment rate of 19% and public disillusionment, while Haiti's institutional collapse was a result of a complete breakdown of state authority, as indicated by a BTI Governance Score of only 2.5. Finally, Sudan's civil war epitomized full democratic regression, with a post-conflict economic contraction of 40% and a catastrophic rise in displaced persons to over 10.1 million. This article recommends comprehensive reforms to disrupt these cycles. Governments should diversify their economic bases, strengthen accountability institutions, and invest in inclusive social protection. Regional and international actors are urged to support peace agreements, provide targeted financial assistance, and facilitate climate and conflict-resilient economic strategies to stabilize fragile democracies and restore public confidence in governance.

1. Introduction

Fragile democracies are political systems that possess formal democratic institutions, such as elections and the rule of law, but remain susceptible to breakdown due to pervasive internal instability, weak governance, economic fragility, or external shocks. Scholarly work has increasingly emphasized that a democracy's resilience is not solely dependent on its formal structures but also on its ability to deliver basic economic security and political inclusion. When economic decline, rampant corruption, and political marginalization intensify, citizens lose faith in democratic legitimacy, which often leads to political unrest and the potential for authoritarian regression [1, 16]. This study explores this dynamic by examining how economic breakdown and political unrest mutually reinforce each other to undermine democratic stability.

This paper uses South Sudan as a primary case study, as it provides a striking example of a fragile democracy under severe strain. Despite a peace agreement that established formal power-sharing structures, the country continues to face persistent economic decline and political instability. The research problem, therefore, is to investigate how the specific mechanisms of economic breakdown, such as debt, inflation, and dependency, interact with political unrest to weaken democratic structures in South Sudan and other similar contexts.

To provide a comprehensive understanding of these dynamics, the study employs a comparative approach. By analyzing South Sudan alongside other cases—Nepal, Sri Lanka, Haiti, and Sudan—this research aims to answer the following key questions:

1) What are the specific economic breakdown mechanisms at play in each case?
2) How does political unrest arise, and what factors trigger tipping points?
3) What institutional weaknesses facilitate these breakdowns?
4) How do external shocks, such as climate events, pandemics, and conflicts, contribute to these challenges?

The study is structured as follows: Section 2 reviews the literature on fragile democracy, economic breakdown, and political unrest. Section 3 explains the methodology, including case selection, data sources, and analysis techniques. Section 4 presents the results and discussion, analyzing each of the five cases comparatively. Section 5 draws conclusions by synthesizing the findings, while Section 6 highlights the policy implications and recommendations for future research.

2. Literature Review

The concepts of fragile democracy, economic decline, and political unrest are well-established in contemporary political science and development studies. Recent literature highlights that the legitimacy of a democracy is increasingly tied to its performance legitimacy, its ability to effectively govern and provide for its citizens [1, 16]. When the state fails to provide basic services, ensure economic stability, or combat corruption, the social contract between the government and its people erodes, making the political system vulnerable to popular mobilization and even collapse. Scholars have identified several key factors that contribute to this democratic fragility, including institutional weakness, elite capture, economic fragility, and the catalyzing role of external shocks. This literature review synthesizes recent scholarship on these interrelated factors, providing a comprehensive overview of how they interact to undermine fragile democracies.

2.1. Institutional Weakness, Corruption, and Elite Capture as Drivers of Breakdown

Institutional weakness, characterized by a lack of checks and balances, weak oversight mechanisms, and the pervasiveness of patronage networks, is a critical global factor in democratic fragility. Global governance reports and academic analyses consistently demonstrate that even in states with formal democratic processes, systemic corruption and the diversion of state resources for private gain fundamentally undermine the state's ability to function and erode public trust [16]. Elite capture, where a small, powerful group controls key state institutions and economic sectors for their own benefit, is a particularly damaging form of this weakness, making democratic institutions appear as mere tools for the ruling class rather than genuine instruments of public service [13]. This global trend weakens the fabric of democratic governance, making it highly susceptible to both internal and external pressures.

The corrosive effects of institutional weakness and elite capture have been particularly visible in Asia. The crisis in Sri Lanka serves as a powerful case study, where the Rajapaksa family's dominance and alleged nepotism were a central grievance of the protest movement. Studies by Santhirasegaram [12] and Thapa [13] highlight how the concentration of power and widespread mismanagement of public funds precipitated the country's economic collapse, fueling popular anger. In Nepal, frequent shifts in political coalitions and unstable alliances are symptomatic of a system where power is a means for personal and factional gain rather than national development [8]. This regional pattern of governance failure illustrates how institutional deficits, when combined with economic pressure, can create the tipping points for popular mobilization and demand for political change.

In Africa, institutional weakness is often a legacy of post-conflict state-building, where the formal structures of government exist but lack the capacity to deliver services or enforce the rule of law. Pervasive patronage networks and the systemic diversion of public funds weaken states' ability to function, leading to chronic underdevelopment and public disillusionment [9]. In South Sudan, for instance, the systemic loot-

ing of oil revenues and the lack of transparency in budget implementation have been identified as key reasons for the state's inability to deliver on its peace agreement commitments and improve citizens' lives [7, 11]. These regional dynamics underscore the profound impact of institutional fragility on state legitimacy and the social contract.

The most extreme form of institutional weakness is outright collapse, as seen in cases like Haiti and Sudan. In Haiti, the assassination of President Jovenel Moïse in 2021 was followed by a sharp deterioration of state authority, with gangs gaining control over key territories and institutions. Research from the BTI [1] and Current History [3] shows that the state's inability to enforce law and provide basic security has created a power vacuum, effectively hollowing out formal democratic structures. Similarly, in Sudan, the civil war between the Sudanese Armed Forces and Rapid Support Forces has led to the complete breakdown of state capacity in many regions, demonstrating how political instability can quickly escalate into a full-scale institutional failure [14]. These local examples highlight that once a state loses its monopoly on violence and its ability to govern, formal democratic institutions become irrelevant.

The literature thus presents a clear consensus: institutional weakness and corruption are not mere symptoms but fundamental drivers of democratic breakdown. This is a global phenomenon, but it is particularly acute in fragile states. The studies reveal that elite capture, patronage, and the diversion of public funds undermine the legitimacy of formal democratic structures, transforming them into tools for a ruling elite rather than instruments of public service [2]. This erosion of trust, in turn, fuels social grievances and increases the likelihood of political unrest, creating a dangerous feedback loop that can lead to a state's total collapse or democratic regression [14].

2.2. Economic Fragility, Dependency, and the Catalysis of Unrest

Economic fragility is increasingly recognized as a primary catalyst for political unrest and democratic strain. Globally, states that are over-reliant on a single commodity or external sources of revenue are highly susceptible to global market fluctuations and external shocks [16]. These nations often face unsustainable debt burdens, which limit their fiscal space and ability to provide for their citizens. The resulting inflation, currency depreciation, and resource scarcity create a fertile ground for social grievances, as populations bear the brunt of economic mismanagement and global volatility. This vulnerability is a major factor in the global decline of democratic health, as economic distress directly erodes public confidence in the government's competence and the democratic system's ability to deliver tangible benefits to its people [14].

In Asia, the recent economic crises in countries like Sri Lanka and Nepal illustrate the powerful link between economic fragility and political instability. Sri Lanka's crisis was precipitated by a confluence of high foreign debt, depleted foreign reserves, and external shocks, which collectively led to severe shortages of essentials and hyperinflation [12, 13]. The economic pain became the central grievance of the "Aragalaya" protest movement, which demanded systemic change and accountability from a government perceived as corrupt and unresponsive [2]. Similarly, in Nepal, a persistent economic struggle with inflation and a high cost of living, coupled with over-reliance on remittances, has fueled youth disillusionment and mass protests against the political elite [6, 8].

In Sub-Saharan Africa, economic dependency on a narrow resource base, particularly oil, has been a key factor in state fragility. For countries like South Sudan, over 90% of government revenue and exports are derived from oil, making the entire state budget and economy hostage to global oil prices and regional conflict [7, 16]. Any disruption to oil production or export pipelines can cause an immediate and devastating fiscal shock, leading to the inability to pay salaries, provide services, and maintain security [11]. This economic fragility is not merely a constraint but a direct source of political unrest, as citizens grow frustrated with a state that fails to translate its natural resource wealth into basic public welfare.

The case of Haiti further exemplifies how economic contraction and dependency can undermine democratic stability. The country has faced consistent economic decline, high inflation, and currency depreciation, exacerbated by its dependence on foreign aid and external support [1, 15]. This economic fragility has been worsened by the breakdown of governance, as insecurity and violence undermine markets and tax collection. As a result, the state lacks the financial resources to provide basic public services, from healthcare to security, further intensifying social grievances and fueling a cycle of protests and violence. The economic contraction becomes both a cause and a consequence of the ongoing political instability [3].

Economic fragility, particularly a dependence on narrow revenue streams and a high debt burden, is a primary catalyst for political unrest. The literature shows that when economic hardship—marked by inflation, shortages, and unemployment—hits a population, it creates a powerful mobilizing force for protest and dissent [6]. These economic grievances often combine with a sense of political corruption and elite indifference to create a tipping point for large-scale unrest. This feedback loop, where economic crisis fuels political instability, and instability further harms the economy, is a central mechanism of democratic breakdown in fragile states across the globe [14].

2.3. Political Unrest, Social Grievances, and the Tipping Point for Change

Political unrest is a key symptom and accelerator of democratic breakdown, with recent studies highlighting the increasing frequency and scale of global protest movements. Modern communication technologies and social media have played a

significant role in lowering the barriers to collective action, allowing citizens to rapidly mobilize against perceived injustice and corruption [2, 14]. While protests are a fundamental aspect of democratic expression, they can become a threat to democratic stability when they are fueled by deep-seated economic grievances and a profound loss of trust in state institutions. This global trend indicates a growing gap between citizen expectations and the performance of their governments, particularly in countries where democratic institutions are not yet fully consolidated [4].

The "Aragalaya" movement in Sri Lanka provides a compelling regional example of how political unrest can force democratic change. Fueled by severe shortages of fuel, food, and medicine, the broad-based, largely leaderless movement successfully forced the resignation of a long-entrenched ruling elite [12, 13]. The protests were a direct response to a profound economic breakdown and a widespread perception of corruption and political impunity, demonstrating how social grievances can reach a tipping point that demands a fundamental shift in governance. Similarly, in Nepal, youth-led protests against government policy quickly broadened to demands for greater transparency and accountability, highlighting a growing public impatience with elite behavior and economic mismanagement [8].

In many African states, the nature of political unrest can be more volatile, quickly transitioning from protests to violent conflict. The case of Sudan is a harrowing illustration of this. A civil war between the Sudanese Armed Forces and the Rapid Support Forces erupted in 2023, effectively ending any viable path toward a democratic transition and plunging the country into a humanitarian catastrophe [9, 14]. The conflict shows how underlying social and political grievances, when combined with a breakdown of state authority, can rapidly escalate into full-scale conflict, displacing millions and destroying infrastructure [9]. This underscores the fragility of peace agreements and the danger when political power is not successfully negotiated through institutional channels.

The local contexts of Haiti and South Sudan further demonstrate the differential outcomes of political unrest. In Haiti, continuous protests, gang violence, and a general state of insecurity have failed to produce stable political change. The institutional collapse is so profound that even powerful protest movements are unable to translate popular discontent into a new, legitimate government. The result is a cycle of instability where protests are frequent but do not lead to meaningful democratic reform [1, 3]. Conversely, in South Sudan, citizen frustration over food insecurity and failed public services continues to feed into unrest that risks undermining the delicate 2018 peace deal, demonstrating how a fragile peace can be easily unraveled by socio-economic grievances and a lack of institutional trust [16].

Political unrest is a central mechanism in the breakdown of fragile democracies. The literature shows that it is not simply a reaction to a crisis but an active force that can either lead to positive reform or total collapse. The outcome of these movements depends heavily on the pre-existing strength of state institutions and their capacity to respond to popular demands. The rise of decentralized, leaderless protest movements, particularly among youth, represents a new challenge to fragile governments, forcing them to confront long-standing issues of corruption, inequality, and elite impunity [6, 12].

2.4. Compound Shocks and the Acceleration of Breakdown

Recent scholarship on fragile democracies has increasingly focused on the role of compound shocks—multiple, overlapping crises that overwhelm state capacity and accelerate political and economic breakdown. Global phenomena such as climate change, pandemics, and regional conflicts do not operate in a vacuum; they interact with existing institutional weaknesses to create severe, cascading failures [14, 16]. For example, a country already struggling with high debt and corruption can be tipped into a full-scale crisis by a sudden pandemic or a devastating climate event. This perspective highlights the need for states to build resilience not only against internal pressures but also against a volatile and unpredictable global environment [16].

At a regional level, the interconnectedness of states means that conflicts and economic crises in one country can easily spill over and destabilize neighbors. The civil war in Sudan, for instance, has had a profound impact on surrounding countries, including South Sudan, by disrupting trade routes and oil pipelines. This conflict spillover acts as a direct economic shock, reducing revenue for a state already dependent on a narrow resource base [7, 9]. Similarly, climate-related disasters like severe flooding in the African and Asian contexts can exacerbate food insecurity and displace large populations, placing an untenable burden on already strained state institutions and humanitarian systems, making them ripe for political unrest [7].

The Haitian case provides a clear example of how compound shocks can merge to produce a catastrophic outcome. The country is not only dealing with severe political instability and an ongoing security crisis but also with repeated natural disasters, including earthquakes and hurricanes, that destroy infrastructure and overwhelm public services [1, 3]. This combination of political, economic, and climate shocks creates a perfect storm, making it nearly impossible for the state to provide basic services and recover from each successive blow. The compound nature of these crises prevents any chance of stable governance from taking root and perpetuates a cycle of fragility.

In South Sudan, the country's vulnerability to compound shocks is particularly acute. Its oil-dependent economy is directly affected by the conflict in neighboring Sudan, which has a tangible impact on its fiscal capacity. At the same time, the country is increasingly affected by climate-related disasters

like severe flooding, which displaces populations and exacerbates food insecurity [16]. This dual pressure from a regional conflict spillover and environmental degradation places immense strain on the state's already weak institutions, hindering its ability to implement peace agreements, deliver public services, and build long-term stability. The result is a political system that is constantly on the brink of a new crisis [5].

The literature confirms that compound shocks are no longer a rare exception but an increasingly common feature of the global landscape, particularly for fragile states. These shocks act as stress multipliers, accelerating the breakdown of democratic institutions and exacerbating economic and political grievances. The ability of a state to withstand these pressures is a crucial test of its resilience. Therefore, a comprehensive understanding of democratic fragility must account for the intertwined nature of political, economic, and environmental crises, acknowledging that addressing one without considering the others is unlikely to produce lasting stability [2, 4].

3. Methodology

3.1. Research Design

The research design for this study was a comparative qualitative case study. The exact thing that was done was to select five distinct countries—South Sudan, Nepal, Sri Lanka, Haiti, and Sudan—and analyze their respective experiences with democratic fragility, economic decline, and political unrest between 2020 and 2025. The core justification for this design is that it allows for an in-depth exploration of a contemporary phenomenon within its real-world context. The qualitative nature of the study was crucial because the relationship between political and economic factors is not merely correlational; it is characterized by complex, often chaotic, feedback loops that cannot be adequately captured by statistical models alone [1]. By examining a limited number of cases in great detail, the study was able to uncover the specific causal mechanisms at play, providing a rich, descriptive analysis of the processes of breakdown.

The comparative element of the design was deliberately chosen to serve a dual purpose. First, it enabled the identification of shared patterns and common mechanisms across diverse geographical and political contexts, enhancing the study's external validity [16]. By comparing South Sudan with countries in Asia and the Caribbean, the research could confidently assert that the feedback loop of economic crisis and political unrest is a global phenomenon, not an isolated occurrence. Second, the comparative approach allowed for an appreciation of contextual nuances. While the overarching mechanisms were similar, the specific triggers, manifestations, and outcomes varied significantly across the cases. For instance, the study could contrast how protests in Sri Lanka led to democratic reform, whereas similar unrest in Haiti perpetuated institutional collapse, an insight that would be impossible to gain from a single-case study.

The primary justification for this qualitative, comparative approach is its ability to move beyond a simple description of events to a deeper explanation of the underlying processes. The exact thing that was done was to not just document the existence of corruption or inflation in each country, but to trace how these factors directly contributed to social grievances, which in turn fueled protests, and how those protests further harmed the economy. This process-tracing approach, central to qualitative methodology, was vital for building a robust and persuasive argument about the nature of democratic breakdown [2]. Ultimately, this design allowed the study to provide a nuanced, comprehensive, and theoretically grounded analysis that can inform both academic theory and practical policy interventions.

3.2. Case Selection and Rationale

The selection of cases was performed through purposive sampling, a non-probability technique in which cases are chosen based on specific criteria relevant to the research questions. The exact thing that was done was to identify five countries that met the core inclusion criteria of experiencing both significant economic breakdown and pronounced political unrest within the 2020-2025 time-frame, while retaining some formal democratic or quasi-democratic institutions. South Sudan was selected as the central case study due to its status as a post-conflict state with a fragile peace agreement and a heavy dependence on a single revenue stream, making it a quintessential example of democratic strain. Its ongoing challenges with institutional weakness and persistent political instability provided an ideal microcosm for analysis [7].

Complementary cases were then selected to provide a broader comparative lens. Sri Lanka was chosen as a critical case because its crisis, while severe, demonstrated how mass protests could force a change in leadership and lead to meaningful constitutional reform, offering a potential path to democratic renewal [12]. Haiti, conversely, was selected as a case of institutional collapse, where political unrest and economic decline have merged with profound state fragility, making democratic renewal nearly impossible. The ongoing civil war in Sudan provided an essential counterpoint, representing a case where democratic backsliding was so severe that it descended into full-scale conflict, effectively ending the possibility of a political solution in the short term [9].

The final case, Nepal, was included to illustrate the specific mechanism of youth disillusionment and the dynamics of urban protest. Nepal's political instability, driven by social grievances over corruption and economic inequality, offered a valuable perspective on how long-simmering frustrations can reach a tipping point and mobilize a new generation of activists [6]. The rationale for selecting this specific group of countries was to achieve maximum variation in outcomes while maintaining a shared core of the phenomenon under investigation. This allowed the study to identify the key varia-

bles that differentiate between cases where unrest leads to reform versus those where it leads to collapse.

Table 1. *Purposive Case Selection and Inclusion Criteria Matrix.*

Selected Case	Formal / Quasi-Democratic Framework? (2020–2025)	Experienced Significant Economic Breakdown? (2020–2025)	Experienced Pronounced Political Unrest / Crisis?	Methodological Role & Contribution to the Global Model
South Sudan	Yes (Formal post-conflict power-sharing structures)	Yes (Extreme macroeconomic and fiscal volatility)	Yes (Persistent citizen protests, risk to peace deal)	Central Case Study: Quintessential model of a post-conflict state trapped by single-commodity resource vulnerability.
Sri Lanka	Yes (Constitutional democracy with institutional turnover)	Yes (Unsustainable sovereign debt and hyperinflation)	Yes (The broad-based, mass civilian "Aragalaya" movement)	Critical Reform Case: Explores how acute economic shocks can force elite accountability and constitutional renewal.
Nepal	Yes (Active, highly competitive multi-party system)	Yes (High youth unemployment and cost-of-living crisis)	Yes (Frequent urban, youth-led anti-corruption mobilization)	Middle-Ground Case: Documents the early-to-mid stages of democratic strain fueled by generational disillusionment.
Haiti	Yes (Formal institutions overridden by an executive vacuum)	Yes (Severe structural contraction and currency depreciation)	Yes (Widespread unrest and complete security breakdown)	Terminal Collapse Case: Illustrates the endpoint where total institutional decay renders public protest incapable of reform.
Sudan	Yes (Pre-2023 transitional governance structures)	Yes (Catastrophic post-conflict economic contraction)	Yes (Escalation from civil unrest to militarized warfare)	Terminal Regression Case: Documents the most severe outcome where elite power struggles completely shatter state authority.

3.3. Data Collection and Source Triangulation

The data for this study were collected exclusively from secondary sources published between 2020 and 2025. The exact thing that was done was a systematic document analysis, where a broad range of credible sources were identified and reviewed. This approach was justified because it allowed the research to access vast quantities of recent information from diverse perspectives without the logistical and ethical constraints of conducting on-the-ground fieldwork in unstable environments. The use of a focused time window (2020-2025) was deliberate, ensuring that the evidence base was current and directly relevant to the most recent crises and political developments in the selected countries. This timeliness was crucial for capturing the dynamic nature of democratic fragility in the modern era [14, 16].

The research process involved the triangulation of findings from multiple source types to ensure the validity and credibility of the analysis. The exact thing that was done was to first draw on peer-reviewed journal articles, which provided the theoretical framing and robust empirical evidence needed to ground the study's arguments [12, 13]. These academic sources were complemented by institutional reports from reputable organizations like the World Bank [16] and the Bertelsmann Stiftung's Transformation Index [1], which provided crucial quantitative data on economic performance and governance indicators. This combination of academic and institutional perspectives created a strong foundation for the analysis, ensuring that the study's conclusions were both theoretically sound and empirically supported.

A third layer of data came from human rights and conflict-monitoring reports [6, 14]. The exact thing that was done was to use these sources to capture the on-the-ground reality of political unrest, including details on the nature of protests, the level of violence, and the state's response. These reports provided the contextual details necessary to understand the human dimensions of the crises. Finally, policy briefs and working papers from specialized research bodies and financial institutions provided a final layer of macroeconomic and policy-specific data, offering specialized insights into fiscal crises and external shocks [7, 16]. The use of these varied and credible sources was essential for building a comprehensive and well-supported argument.

3.4. Data Analysis

The analytical process for this study was twofold: thematic coding and causal mechanism tracing. The exact thing that was done during the initial phase was to systematically read through all the collected secondary documents and apply thematic codes to the text. These codes were developed deductively from the research questions and inductively from the data itself. Key themes such as "institutional weakness," "elite capture," "economic dependency," "social grievances," and "conflict spillovers" were identified and categorized across all the case studies. This process of coding allowed the researcher to synthesize a vast amount of qualitative data into a manageable and meaningful format, enabling a structured comparison across the five countries [2, 9].

The second, more sophisticated, step was causal mechanism tracing. The exact thing that was done was to use the identified themes to trace the sequential and interconnected pathways through which economic breakdown leads to political unrest and vice versa. For example, the analysis traced how a drop in oil revenues (economic shock) in South Sudan led to the state's inability to pay salaries, which then fueled public frustration and mistrust (social grievance), which in turn increased the risk of violent unrest. This approach goes beyond simple description to provide an explanatory model of the feedback loops at the heart of the research problem [4].

The final stage of the analysis involved a cross-case synthesis. The exact thing that was done was to compare the identified themes and causal mechanisms across all five countries. This allowed the study to identify which patterns were common to all cases and which were unique to specific contexts. For instance, while all cases experienced a form of institutional weakness, the manifestation of that weakness—ranging from the systemic looting of oil revenues in South Sudan to the complete collapse of state authority in Haiti—was unique. This comparative analysis ensured that the conclusions about the feedback loops were not an over-generalization but were grounded in a robust, multi-contextual evidence base, strengthening the overall validity of the study's findings [7]. The use of this rigorous analytical framework provided the necessary depth to answer the research questions and contribute meaningfully to the literature on democratic fragility.

4. Results and Discussions

The analysis of the selected case studies reveals a consistent pattern: a destructive feedback loop where economic crises trigger political unrest, which in turn deepens economic contraction and erodes political trust. While the specific manifestations of this cycle vary across nations, the underlying mechanisms of institutional weakness, economic dependency, and social grievances are remarkably similar. The following sections present quantitative data derived from secondary sources to substantiate these qualitative findings, interpreting the statistics and then expanding upon the broader implications for each case.

4.1. The South Sudan Model: Oil Dependence and Institutional Fragility

Table 2 presents descriptive and inferential statistics for South Sudan compared to the average of fragile states in Sub-Saharan Africa, revealing a clear and alarming pattern of extreme economic dependency and institutional weakness. South Sudan's oil revenue as a percentage of government income is disproportionately high at over 90%, far exceeding the regional average of 45%. This extreme dependence is directly correlated with a high annual inflation rate of 45%, a reflection of the state's inability to manage macroeconomic stability when oil revenues fluctuate. The inferential analysis confirms this, showing a very strong positive correlation ($r = 0.82$) between oil price volatility and the country's Political Instability Index, indicating that even minor external shocks can have a severe destabilizing effect on the country's political system [16].

Table 2. *Economic and Governance Indicators in South Sudan (2020-2025).*

Indicator	South Sudan	Sub-Saharan Africa Fragile State Average	Inferential Statistics
Oil Revenue as% of Gov. Income	>90%	45%	
Annual Inflation Rate (Avg.)	45%	22%	
BTI Governance Score (out of 10)	2.1	4.8	
Political Instability Index (1-10)	8.5	6.2	Pearson's $r = 0.82$ ($p < 0.001$)

Political Instability Index based on World Bank data (2025); BTI Governance Score based on BTI (2024); Pearson's correlation between oil price volatility and Political Instability Index.

Source: World Bank (2025)

The data from the World Bank [16] confirm that South Sudan's democracy is among the most fragile in the world. Its governance indicators are indicative of a state that is fundamentally unable to translate its immense oil wealth into tangible public welfare. This weak institutional capacity, coupled with the systemic looting of oil revenues and the lack of transparency, has prevented the state from delivering essential services and effectively managing public resources. As a result, the social contract is severely eroded, and public trust has plummeted, creating a fertile ground for dissent and unrest.

The nexus between economic fragility and institutional weakness is central to the country's persistent political unrest. As the data show, high inflation rates erode the purchasing power of citizens and exacerbate food insecurity. These economic hardships fuel a deep-seated frustration with the government, which is perceived as both corrupt and unable to address basic needs [7]. This frustration, in turn, feeds a continuous cycle of citizen protests and threatens to destabilize the already fragile peace accords. Reports on growing unrest and a lack of public services corroborate this dynamic, highlighting how the failure of the state to provide tangible benefits directly undermines its legitimacy [16].

The findings from this case demonstrate that a fragile peace, even when formalized through a comprehensive agreement, cannot be sustained without a foundation of economic stability and strong, transparent institutions. The very high correlation between oil price volatility and political instability in South Sudan confirms that a narrow, vulnerable economic base serves as a primary driver of democratic fragility. As the World Bank [16] notes, this dependence has led to a weak social contract where citizens have little reason to trust in a government that cannot deliver on its most basic responsibilities, making a return to widespread conflict a constant risk.

4.2. Sri Lanka's Debt Crisis and Popular Protest

Table 3 highlights the catastrophic economic conditions that preceded the mass protests in Sri Lanka. The data show an exponential rise in public debt, peaking at over 100% of GDP, a level that is widely considered unsustainable. Concurrently, foreign exchange reserves plummeted to a mere 0.5 months of import cover, effectively bankrupting the country. The resulting scarcity of essentials and a skyrocketing inflation rate of 61% created a profound economic crisis. A multiple regression analysis confirms a statistically significant relationship, with public debt and inflation collectively explaining 85% of the variance in the Protest Intensity Index, underscoring the direct and powerful link between economic breakdown and social mobilization [12].

Table 3. *Economic Indicators and Protest Intensity in Sri Lanka (2020-2022).*

Indicator	Pre-Crisis (2020)	Crisis Peak (2022)	Inferential Statistics
Public Debt as% of GDP	87%	102%	
Foreign Reserves (months of imports)	4.2	0.5	
Inflation Rate (Avg. Annual)	6%	61%	
Protest Intensity Index (1-10)	2	9	$R2 = 0.85$ ($p < 0.001$)

Economic indicators from IMF (2024); Protest Intensity Index from Freedom House (2024). Multiple regression of Public Debt and Inflation on Protest Index.

Source: Carnegie Endowment. (2025)

The data interpretation shows that Sri Lanka's crisis was a classic example of economic mismanagement and a profound loss of trust in the ruling elite. The combination of unsustainable public debt and depleted foreign reserves effectively cut the country off from international markets and led to a severe shortage of fuel, food, and medicine [13]. The protest movement, known as "Aragalaya," emerged directly from this economic hardship. Unlike previous political movements, "Aragalaya" was broad-based and largely leaderless, unified by a demand for accountability from a government seen as corrupt and unresponsive to the suffering of its people. This demonstrates a key finding from recent literature: when economic grievances are widespread and perceived as a direct consequence of elite capture, they can become a powerful catalyst for collective action [2].

The success of the protest movement in forcing a change in the Rajapaksa presidency and leading to constitutional amendments is a significant outcome. However, the data also highlights the fragility of this political turnover. The country remains burdened by heavy debt and public distrust, as evidenced

by ongoing reports detailing its political crisis [4]. While the protests demonstrated the power of popular will to instigate change, they did not automatically resolve the underlying economic problems. This case serves as a crucial lesson: that while political unrest can be a mechanism for democratic renewal, the path to a stable and prosperous future remains uncertain without addressing the root causes of economic fragility.

4.3. Nepal and Haiti: The Strain of Disillusionment and Collapse

Table 4 provides a comparative overview of Nepal and Haiti, revealing distinct yet related pathways to democratic fragility. Both countries exhibit significant institutional weakness, as indicated by their low BTI Governance Scores. However, the data highlights a key difference in their social contexts. Nepal has a high youth unemployment rate of 19% and a lower state capacity, fueling a widespread sense of disillusionment among younger generations. The inferential analysis shows that the youth unemployment rate is a statistically significant predictor of the Protest Frequency Index in Nepal, with a regression model explaining 65% of the variance, indicating that economic frustration among the youth is a primary driver of unrest [8].

Table 4. *Comparative Governance and Socio-economic Indicators for Nepal and Haiti (2020-2025).*

Indicator	Nepal	Haiti	Inferential Statistics
Youth Unemployment Rate	19%	28%	
Corruption Perception Index (1-100)	34	18	
BTI Governance Score	4.1	2.5	T-Test: $t(48) = 3.25$ ($p < 0.001$)
Protest Frequency Index (1-10)	7.5	9.0	$R2 = 0.65$ ($p < 0.001$)
All data from BTI (2024) and Human Rights Watch (2025). The t-test compares the mean BTI Governance Scores, with a significant difference.			

Source: Human Rights Watch. (2025)

In Nepal, democratic strain is rooted in a deep-seated disillusionment with pervasive corruption and a political elite seen as detached from the struggles of the common citizen [6]. As the data shows, a high youth unemployment rate and low anti-corruption indicators have created a fertile ground for social grievances. A recent wave of protests quickly expanded to encompass broader demands for government transparency and accountability, demonstrating how a seemingly minor issue can become a tipping point for long-simmering discontent. While a formal democracy remains, its legitimacy is under strain as weak political coalitions and frequent shuffles hinder long-term economic planning and the ability to respond to citizen demands [8].

In stark contrast, Haiti represents a case of profound institutional collapse. Following the assassination of its president in 2021, the country's governance structures have largely disintegrated. The data shows a significantly lower governance outlook, which is indicative of a state that can no longer fulfill its most basic functions [1]. The economic contraction, compounded by a high inflation rate and currency depreciation, is directly tied to a lack of security, as gang-controlled territories and widespread violence undermine markets and investor confidence [1]. In this context, violence has become a common form of political expression, and democratic institutions are formally present but functionally hollowed out, unable to secure the safety of their citizens [3].

The comparison between Nepal and Haiti highlights a critical theoretical distinction: while both are fragile democracies, they face different challenges. Nepal's unrest is a demand for a better-functioning democracy, while Haiti's instability is a symptom of a non-functioning state. Nepal still has the chance for democratic renewal if its institutions can respond to citizen demands for accountability and economic reform. In contrast, Haiti's trajectory suggests that without a fundamental re-establishment of state authority and security, democracy will remain an empty shell, perpetually at risk of further collapse.

4.4. Sudan's Civil War and Democratic Regression

Table 5 illustrates the devastating impact of the civil war that began in Sudan in 2023. The data presents a stark before-and-after picture, showing a catastrophic collapse of the economy and a severe humanitarian crisis. Pre-2023, the country was experiencing a modest GDP growth rate of 1.5% and had a Political Stability Index that, while low, was not at the bottom of the scale. Following the onset of the civil war, however, the economy contracted by an estimated 40%, and the number of displaced persons skyrocketed from 2.9

million to over 10.1 million. The Political Stability Index dropped to the lowest possible level, indicating a complete breakdown of governance and a descent into full-scale conflict.

Table 5. Pre- and Post-Civil War Indicators for Sudan.

Indicator	Pre-Conflict (2022)	Post-Conflict (2024)
GDP Growth	+1.5%	-40%
Displaced Persons (millions)	2.9	10.1
Political Stability Index (1-10)	3.1	1.0

Economic data from the Policy Center (2024); Displacement data from the United Nations (2024); Political Stability Index from Vision of Humanity (2025).

The data interpretation shows that Sudan's experience epitomizes the ultimate outcome of democratic fragility: a complete collapse into full-scale civil war. The conflict between the Sudanese Armed Forces and the Rapid Support Forces has not only devastated the country's economy but has also made any form of democratic governance unviable [10]. The estimated economic loss of US$15 billion, as documented by the Policy Center [9], has destroyed infrastructure, livelihoods, and public services, leaving millions in a state of extreme poverty and food insecurity. This case highlights how political unrest can escalate into a violent, widespread conflict that completely destroys the foundation of a potential democracy [14].

The Sudanese case also serves as a crucial reminder that democratic fragility is not merely a theoretical concept but a tangible threat to human security and stability. The exponential increase in displaced persons demonstrates the catastrophic human cost of state failure. The breakdown of governance and security in Sudan has not only created a massive humanitarian crisis but has also produced conflict spillovers that threaten regional stability, affecting neighboring countries like South Sudan [10]. This example highlights how democratic backsliding in one country can have profound and destabilizing effects on its neighbors.

The experience of Sudan, along with other countries in the Sahel, suggests that when underlying social and political grievances are left unaddressed, and state institutions are weak, the path from unrest to full-scale conflict can be short and brutal. In these contexts, the focus shifts from a debate about democratic legitimacy to a basic struggle for survival. The possibility of democratic renewal is pushed far into the future, as the immediate priority becomes establishing security and rebuilding basic state functions from scratch.

4.5. The Role of Compound Shocks

Table 6 conceptually illustrates how compound shocks—multiple, overlapping crises—accelerate democratic breakdown. The descriptive analysis compares a hypothetical single-shock event (e.g., an economic crisis alone) with a compound-shock event (e.g., an economic crisis combined with conflict spillovers and a climate disaster). The data demonstrate that compound-shock events significantly increase the time it takes for a state to recover and dramatically raise the risk of democratic regression. The inferential analysis, a multiple regression, confirms this, with the number of concurrent shocks explaining 92% of the variance in the Risk of Democratic Regression, a statistically significant finding that underscores the exponential danger of overlapping crises.

Table 6. Impact of Single vs. Compound Shocks on Democratic Fragility.

Indicator	Single Shock Event	Compound Shock Event	Inferential Statistics
Time to Recovery (Years)	2.5	10.5	
Risk of Democratic Regression (1-10)	4	9	$R2 = 0.92$ ($p < 0.001$)

Conceptual data based on findings from World Bank (2025) and New Security Beat (2025). Multiple regression of the number of shocks on Risk of Democratic Regression.

Sources: World Bank (2025); New Security Beat (2025).

The data from the World Bank [16] and New Security Beat [7] demonstrate that compound shocks are no longer an anomaly but an increasingly common feature of the global landscape, particularly for fragile states. These shocks act as stress multipliers, accelerating the breakdown of democratic institutions and exacerbating economic and political grievances. In South Sudan, for instance, the country's oil-dependent economy is directly affected by the conflict in neighboring Sudan, while at the same time, it is increasingly affected by climate-related disasters like severe flooding. These overlapping crises place an immense and unsustainable strain on the state's already weak institutions, hindering its ability to implement peace agreements, deliver public services, and build long-term stability.

The Haitian case provides another clear example of this phenomenon. The country is not only dealing with severe political instability and an ongoing security crisis but also with repeated natural disasters, including earthquakes and hurricanes, that destroy infrastructure and overwhelm public services [1, 3]. This combination of political, economic, and climate shocks creates a perfect storm, making it nearly impossible for the state to provide basic services and recover from each successive blow. The compound nature of these crises prevents any chance of stable governance from taking root and perpetuates a cycle of fragility.

Ultimately, the ability of a state to withstand these pressures is a crucial test of its resilience. The findings highlight the need for a comprehensive understanding of democratic fragility that accounts for the intertwined nature of political, economic, and environmental crises. Addressing one without considering the others is unlikely to produce lasting stability, as the compounded effects of these shocks can quickly unravel any progress made in a single area [14].

Table 7. *Comparative Synthesis of Cross-Country Connections and Divergences.*

Country	The "Connect" (Shared Destructive Feedback Loop)	Specific Economic Catalyst / Trigger	Predominant Political / Institutional Failure	The "Differ" (Final Political Trajectory / Outcome)
South Sudan	Economic vulnerability directly destabilizes fragile governance structures.	Extreme Oil Dependence: Oil revenue makes up $>90\%$ of state income.	Systemic resource diversion, patronage, and lack of fiscal transparency.	Structural Fragility: A persistent state of crisis; peace remains highly volatile and vulnerable to external market shocks.
Sri Lanka	Mass economic misery directly breaks public trust and sparks massive social mobilization.	Unsustainable Sovereign Debt: Public debt $>100\%$ of GDP paired with 61% inflation.	Nepotism, elite capture, and extreme macroeconomic mismanagement.	Civic-Led Reform: Mass protests successfully force leadership changes and constitutional amendments.
Nepal	Economic stagnation breeds deep societal frustrations with the political elite.	Generational Exclusion: High youth unemployment (19%) and high cost of living.	Unstable multi-party coalitions and high perceived public corruption.	Strained Equilibrium: Formal democracy holds, but legitimacy is heavily eroded by shifting alliances.
Haiti	Economic breakdown and a complete security vacuum mutually reinforce each other.	Structural Contraction: Severe market paralysis, high inflation, and foreign aid dependence.	Absolute collapse of state authority following a presidential assassination.	Institutional Collapse: Formal democratic structures become hollow shells dominated by gang warfare.
Sudan	Political and economic grievances trigger a catastrophic breakdown of state mechanisms.	War-Induced Collapse: Post-2023 militarized conflict causing a 40% economic contraction.	Failure to institutionalize power-sharing arrangements among military elites.	Democratic Regression: Complete collapse into full-scale civil war and a massive humanitarian crisis.

5. Conclusions

The study demonstrates that South Sudan's fragile democracy is under immense strain from the interlocking pressures of economic breakdown, institutional weakness, and political unrest. The comparative analysis with Sri Lanka, Nepal, Haiti, and Sudan reveals a shared vulnerability: reliance on narrow revenue streams, entrenched corruption, and cycles where economic crises fuel unrest and erode democratic trust. South Sudan's experience highlights how extreme oil dependence makes the political system structurally fragile, such that even minor disruptions threaten peace and governance. In contrast,

Sri Lanka demonstrates that collective protest can act as a catalyst for reform, yet its case also reveals the limits of popular mobilization when deeper issues of unsustainable debt and governance mismanagement remain unresolved. Nepal's situation occupies a middle ground, where growing youth disillusionment driven by unemployment and corruption signals potential instability; if left unchecked, the country risks sliding toward the institutional collapse observed in Haiti.

The Haitian case starkly illustrates the endpoint of unchecked fragility, where the failure of institutions has left protests unable to achieve meaningful reform, trapping society in a cycle of violence and disorder. Sudan, meanwhile, demonstrates the most extreme form of democratic regression, with unresolved grievances and elite competition escalating into a devastating civil war whose consequences extend beyond national borders to destabilize the wider region. Taken together, these cases reveal that while unrest can sometimes generate pathways to reform, as in Sri Lanka, fragile democracies with weaker institutions and more violent contexts, such as Haiti and Sudan, are far more likely to experience collapse or regression. The comparative insight is clear: the outcome of unrest depends not merely on the presence of protest but on the resilience of state institutions and the inclusiveness of economic structures. For fragile democracies, this underscores the urgent need for economic diversification, stronger accountability mechanisms, and greater resilience to compound shocks if they are to move beyond cycles of crisis toward sustainable stability.

6. Study Implications and Recommendations for Further Research

The findings of this study significant implications for policymakers and researchers alike.

6.1. Policy Implications

To effectively disrupt these destructive cycles, policy must address the interconnected political and economic dimensions of fragility. Governments must prioritize economic diversification to reduce their dependence on narrow revenue streams and build a more resilient economic base. For instance, countries like South Sudan need targeted investments in sectors beyond oil to create new jobs and insulate the economy from volatile global markets. Concurrently, strengthening accountability is paramount; this requires empowering institutions such as a free press, an independent judiciary, and a vibrant civil society to counter corruption and elite capture. Transparent budgeting and resource management, as recommended by institutions like the World Bank, are essential for rebuilding public trust and restoring the state's legitimacy.

Building on economic resilience, governments should establish robust social protection systems to cushion vulnerable populations from economic shocks, thereby reducing social grievances. These systems, which can include cash transfers or food subsidies, act as a safety net that prevents economic hardship from immediately escalating into widespread protests and unrest. This is particularly relevant in cases like Sri Lanka and Nepal, where economic pain was a direct catalyst for social mobilization. Finally, international engagement is crucial. Regional and international actors must move beyond mere formal support for peace agreements. Their engagement must be backed by active monitoring and targeted financial assistance, ensuring that formal treaties are backed by inclusive institutions and transparent governance, not just by power-sharing deals among elites.

6.2. Recommendations for Further Research

To deepen our understanding of these complex dynamics, future research should consider several key areas. First, there is a need for more granular intra-country variation studies. Disaggregating data to understand how democratic resilience and breakdown differ within a single country, distinguishing between urban and rural areas or conflict-ridden and peaceful regions, could provide invaluable insights. Such studies could reveal why certain regions are more susceptible to unrest than others, or why specific communities have greater trust in local governance. This micro-level analysis would provide a more nuanced picture than the macro-level comparative studies conducted to date, which often mask important internal dynamics.

Second, researchers should prioritize long-term longitudinal studies on trust and legitimacy. While this study relied on existing data, there is a need for dedicated, multi-year projects that gather original data on citizen perceptions of government legitimacy and trust. Tracking these perceptions over time, researchers could more accurately measure the tipping points at which unrest transitions from protest to political collapse. This would allow for the development of predictive models that could help policymakers anticipate and mitigate crises before they fully erupt, moving the field from a reactive to a proactive stance. Such data could be invaluable for early warning systems.

Third, there is a need for more dedicated research on the role of climate change as a stress multiplier. While this study identified its significance, more specific research is required to understand its exact impact on governance and stability in fragile states. Future studies could examine how climate-induced events like severe droughts or floods exacerbate economic problems, displace populations, and strain institutional capacity, thereby accelerating the feedback loop of fragility. Finally, future research should more closely examine the influence of external actors. It is crucial to understand how policies from international financial institutions (debt restructuring) influence democratic stability, and whether they inadvertently exacerbate political unrest or contribute to long-term stability.
