Abstract: Our aim in this study is to give the Gagliardo-Nirenberg Inequality as a consequence of pointwise estimates for the function in terms of the Riesz potential of the gradient. Our aim here is to discuss boundedness of Riesz potential in term of maximal functions and to give the proof for Gagliardo-Nirenberg Inequality in term of Riesz potential. We will extend our result to discuss weak type estimate for Gagliardo-Nirenberg Sobolev inequality. Further, in this paper we are interested to extract Sobolev type inequality in terms of Riesz potentials for α is equal to one and to extend our work for weak type estimates when p is equal to one.

Keywords: Gagliardo-Nirenberg Inequality, Hardy Littlewood Maximal Function, Riesz Potential, Sobolev Type Inequality

1. Introduction

The Hardy-Littlewood maximal function was considered as a classical tool in various areas such as potential analysis and harmonic analysis from years and later in Sobolev space theory and partial differential equations see [1, 4, 12], and [13]. Sobolev space plays a significant role in dealing with existence and regularity of solutions of Partial Differential Equations see [5, 8]. The Hardy-Littlewood maximal function bridging between functional analysis, sobolev spaces and partial differential equations [7, 9, 11, 17]. Boundedness of Maximal function has been discussed earlier with different arguments such as, Boundedness and regularity of maximal functions on hardy-sobolev spaces discussed in [15]. Luiro generalized the original boundedness result and established the continuity of the centered maximal operator in $W^{1,p}(R^d)$, $1 < p < \infty$ [13]. P. Hajlasz and J. Onninen proved the boundedness of the spherical maximal function in the Sobolev space $W^{1,p}(\Omega)$, $p > \frac{d}{d-1}$. For other arguments and related results, one can see [10, 16] and [18]. With the strong arguments over the boundedness of Hardy-Littlewood Maximal function, our aim here is to discuss boundedness of Riesz potential in term of maximal functions and to give the

proof for Gagliardo-Nirenberg Inequality in term of Riesz potential. We will extend our result to discuss weak type estimate for Gagliardo-Nirenberg sobolev inequality.

We start by recalling the definition of maximal function.

Let $B(y, a) = \{x \in R^d : |x - y| < a\}$ is an open ball having center at $y \in R^d$ and radius $a > 0$ then

$Mf: R^d \rightarrow [0, \infty]$ where $f \in L^1_{loc}(R^d)$ is

$$Mf(y) = \sup_{a>0} \frac{1}{|B(y,a)|} \int_{B(y,a)} |f(x)| dx \quad (1)$$

As from Lebesgue differentiation theorem, for all $y \in R^d$

$$\begin{aligned} |f(y)| &= \lim_{a>0} \frac{1}{|B(y,a)|} \int_{B(y,a)} |f(x)| dx \\ &\leq \sup_{a>0} \frac{1}{|B(y,a)|} \int_{B(y,a)} |f(x)| dx = Mf(y) \end{aligned}$$

As maximal function approach involves in our theme of work, we will begin with some basic and obvious results.

Lemma 1: If $f \in L^\infty(R^d)$, then $Mf \in L^\infty(R^d)$ and $\|Mf\|_{L^\infty(R^d)} \leq \|f\|_{L^\infty(R^d)}$.

Proof: For any $a > 0$ and for all $y \in R^d$ we can write

$$\begin{aligned} \frac{1}{|B(y, a)|} \int_{B(y, a)} |f(x)| dx &\leq \frac{1}{|B(y, a)|} \|f\|_{L^\infty(R^d)} |B(y, a)| \\ &= \|f\|_{L^\infty(R^d)} \end{aligned}$$

$$\sup_{a>0} \frac{1}{|B(y, a)|} \int_{B(y, a)} |f(x)| dx \leq \|f\|_{L^\infty(R^d)}$$

Using (1.1), we have $Mf(y) \leq \|f\|_{L^\infty(R^d)}$

Thus $\|Mf\|_{L^\infty(R^d)} \leq \|f\|_{L^\infty(R^d)}$

It shows the maximal function will essentially bounded with the boundedness of original function and thus finite everywhere. See [9]

Hardy-Littlewood-Wiener theorem states that:

If $f \in L^1(R^d)$, there exist $c = c(d)$ such that

$$|\{y \in R^d : Mf(y) > \lambda\}| \leq \frac{c}{\lambda} \|f\|_{L^1(R^d)} \text{ for every } \lambda > 0 \quad (2)$$

This result indicates that Mf maps from $L^1(R^d)$ to weak $L^1(R^d)$ and $f \in L^1(R^d)$ does not claim about $Mf \in L^1(R^d)$ and thus Hardy-Littlewood maximal operator is not bounded in $L^1(R^d)$. In this case we can get only weak type estimates. Hajlasz and Onninen raised same type of question in [15]. Later on Tanaka [6] gave its answer positively for $d = 1$.

If $f \in L^p(R^d)$, $1 < p \leq \infty$, so is $Mf \in L^p(R^d)$ then there exist $c = c(d, p)$ such that

$$\|Mf\|_{L^p(R^d)} \leq c \|f\|_{L^p(R^d)} \quad (3)$$

This result shows that Hardy-Littlewood operator is bounded in $L^p(R^d)$ for $p > 1$

Lemma 2: If $v \in C_0^1(R^d)$, then for every $y \in R^d$ and ω_{d-1} , the $(d-1)$ -dimensional measure of $\partial B(1, 0)$

we have $v(y) = \frac{1}{\omega_{d-1}} \int_{R^d} \frac{Dv(x) \cdot (y-x)}{|y-x|^d} dx$

Proof: We will use fundamental theorem of calculus and start the case by taking one dimensional case.

If $v \in C_0^1(R)$, then there exists interval $[l, m] \subset R$ and $v(y) = 0$ for all $y \in R \setminus [l, m]$

We can write with the help of fundamental theorem of calculus

$$v(y) = v(l) + \int_l^y v'(x) dx = \int_{-\infty}^y v'(x) dx \quad (4)$$

In another way we can write for initial condition $v(l) = 0$ as

$$0 = v(m) = v(y) + \int_y^m v'(x) dx = v(y) + \int_y^\infty v'(x) dx,$$

Or

$$v(y) = - \int_y^\infty v'(x) dx \quad (5)$$

From (3) and (4) we have, $2v(y) = \int_{-\infty}^y v'(x) dx - \int_y^\infty v'(x) dx$

$$= \int_{-\infty}^y \frac{v'(x)(y-x)}{|y-x|^d} dx + \int_y^\infty \frac{v'(x)(y-x)}{|y-x|^d} dx$$

$$= \int_{-\infty}^\infty \frac{v'(x)(y-x)}{|y-x|^d} dx$$

Thus $v(y) = \frac{1}{2} \int_R \frac{v'(x)(y-x)}{|y-x|^d} dx$ for all $y \in R$

Now, we will extend the result for R^n ,

If $x \in R^n$ and $\xi \in \partial B(1, 0)$, fundamental theorem of calculus help us to write

$$v(y) = - \int_0^\infty \frac{\partial}{\partial t} (v(y + t\xi)) dt = \int_0^\infty Dv(y + t\xi) \cdot \xi dt$$

Fubini theorem implies,

$$\omega_{d-1} v(y) = v(y) \int_{\partial B(1, 0)} 1 dS(\xi)$$

$$= \int_{\partial B(1, 0)} \int_0^\infty Dv(y + t\xi) \cdot \xi dt dS(\xi)$$

Applying Fubini $= - \int_0^\infty \int_{\partial B(1, 0)} Dv(y + t\xi) \cdot \xi dS(\xi) dt$

Considering $x = t\xi$, $dS(\xi) = t^{1-d} dS(x)$ we have

$$\begin{aligned} &= - \int_0^\infty \int_{\partial B(1, 0)} Dv(y + x) \cdot \frac{x}{t^{d-1}} dS(x) dt \\ &= - \int_0^\infty \int_{\partial B(1, 0)} Dv(y + x) \cdot \frac{x}{|x|^d} dS(x) dt \end{aligned}$$

In terms of polar coordinates, we can express as,

$$= \int_{R^d} \frac{Dv(y + x) \cdot x}{|x|^d} dx$$

replacing $z = y + x$, $dx = dz = \int_{R^d} \frac{Dv(z) \cdot z - y}{|z - y|^d} dz$

or $= \int_{R^d} \frac{Dv(x) \cdot y - x}{|y - x|^d} dx$

$$\text{Thus } v(y) = \frac{1}{\omega_{d-1}} \int_{R^d} \frac{Dv(x) \cdot (y-x)}{|y-x|^d} dx \quad (6)$$

This is the representation formula for a compactly supported continuously differential function in term of its gradient.

By Cauchy-Schwarz inequality and Lemma 2, we can write

$$\begin{aligned} |v(y)| &= \left| \frac{1}{\omega_{d-1}} \int_{R^d} \frac{Dv(x) \cdot y - x}{|y - x|^d} dx \right| \\ &\leq \frac{1}{\omega_{d-1}} \int_{R^d} \frac{|Dv(x)| |y - x|}{|y - x|^d} dx \\ &\leq \frac{1}{\omega_{d-1}} \int_{R^d} \frac{|Dv(x)|}{|y - x|^{d-1}} dx \\ &\leq \frac{1}{\omega_{d-1}} I_1(|Dv|)(y) \end{aligned} \quad (7)$$

Where $I_1 f$ denotes the Reisz Potential for $\alpha = 1$.

For $0 < \alpha < d$, Reisz Potential of order α can be deduced as

$$I_\alpha f(y) = \int_{R^d} \frac{f(x)}{|y-x|^{d-\alpha}} dx. \quad (8)$$

One who interested in fundamental properties of Riesz potentials, see e.g. [12].

In case of compactly supported smooth functions, the above result is useful for pointwise bound of functions in term of Riesz potential of the gradient. Some authors have obtained some results for Riesz potential for example Armin Schikorra and Daniel Spector [2] established new L^1 -type estimate for Riesz potential. In [3], Petteri Harjulehto, Ritva Hurri-Syrjänen, obtained Pointwise estimates to the modified Riesz potential. Using the similar results, they obtained Poincare Inequality for irregular domain. The inequality of Gagliardo-Nirenberg-Sobolev type was established for non-isotropic Generalized Riesz Potential depending on λ -distance by Inan Cinar in [18]. Our point of interest here is to discuss boundedness of Riesz Potential by Maximal Operator and then to obtain Gagliardo-Nirenberg inequality

Before moving to the main results, we shall elaborate few technical lemmas for Riesz potential for $\alpha = 1$

Lemma 3: If $\psi \subset R^d$ is a measureable set and $|\psi| < \infty$, then

$$\int_{\psi} \frac{1}{|y-x|^{d-1}} dx \leq c(d)|\psi|^{\frac{1}{d}}$$

Proof: Consider a ball $B = B(y, a)$ with $|B| = |\psi|$. This implies that $|\psi \setminus B| = |B \setminus \psi|$.

We are able to write:

$$\int_{\psi \setminus B} \frac{1}{|y-x|^{d-1}} dx \leq |\psi \setminus B| \frac{1}{a^{d-1}}$$

And 2- $|\psi \setminus B| \frac{1}{a^{d-1}} \leq \int_{\psi \setminus B} \frac{1}{|y-x|^{d-1}} dx$ as $|B| = |\psi|$ and $|\psi \setminus B| = |B \setminus \psi|$, then by comparing above inequalities

$$\begin{aligned} \int_{\psi} \frac{1}{|y-x|^{d-1}} dx &= \int_{\psi \setminus B} \frac{1}{|y-x|^{d-1}} dx \\ &\quad + \int_{\psi \cap B} \frac{1}{|y-x|^{d-1}} dx \\ &\leq \int_{\psi \setminus B} \frac{1}{|y-x|^{d-1}} dx + \int_{\psi \cap B} \frac{1}{|y-x|^{d-1}} dx \\ &= \int_B \frac{1}{|y-x|^{d-1}} dx \\ &= c(d)a = c(d)|B|^{\frac{1}{d}} = c(d)|\psi|^{\frac{1}{d}} \end{aligned}$$

Lemma 4: Let $1 \leq p < \infty$ and assuming $|\Omega| < \infty$ then

$$\|I_1(|f|\chi_{\Omega})\|_{L^p(\Omega)} \leq c(d, p) |\Omega|^{\frac{1}{d}} \|f\|_{L^p(\Omega)}$$

Proof: For $p > 1$, by applying Holder inequality, Lemma 3 can be expressed as

$$\begin{aligned} \int_{\Omega} \frac{|f(x)|}{|y-x|^{d-1}} dx \\ = \int_{\Omega} \frac{|f(x)|}{|y-x|^{\frac{1}{p}(d-1)}} \frac{1}{|y-x|^{\frac{1}{p'}(d-1)}} dx \end{aligned}$$

$$\begin{aligned} &\leq \left(\int_{\Omega} \frac{|f(x)|^p}{|y-x|^{(d-1)}} dx \right)^{\frac{1}{p}} \left(\int_{\Omega} \frac{1}{|y-x|^{(d-1)}} dx \right)^{\frac{1}{p'}} \\ &\leq c|\Omega|^{\frac{1}{dp'}} \left(\int_{\Omega} \frac{|f(x)|^p}{|y-x|^{(d-1)}} dx \right)^{\frac{1}{p}} \\ &\leq c|\Omega|^{\frac{p-1}{dp}} \left(\int_{\Omega} \frac{|f(x)|^p}{|y-x|^{(d-1)}} dx \right)^{\frac{1}{p}} \end{aligned}$$

For $p = 1$, the above inequality is satisfied. Hence, Using Lemma (3) and Fubini's theorem

$$\begin{aligned} \int_{\Omega} |I_1(|f|\chi_{\Omega})(y)|^p dy &\leq c|\Omega|^{\frac{p-1}{d}} \int_{\Omega} \int_{\Omega} \frac{|f(x)|^p}{|y-x|^{(d-1)}} dx dy \\ &\leq c|\Omega|^{\frac{p-1}{d}} |\Omega|^{\frac{1}{d}} \int_{\Omega} |f(x)|^p dx \end{aligned}$$

This result gives the idea, if $|\Omega| < \infty$, then $I_1: L^p(\Omega) \rightarrow L^p(\Omega)$ is bounded for $1 \leq p < \infty$.

We are now able to discuss the boundedness of Riesz Potential by the Hardy-Littlewood maximal function for general α .

Lemma 5: If $0 < \alpha < d$, then for every $y \in R^d$ and $a > 0$, there exist $c = c(d, \alpha)$, such that

$$\int_{B(y, a)} \frac{|f(x)|^p}{|y-x|^{(d-\alpha)}} dx \leq ca^{\alpha} Mf(y)$$

Proof: Let we denote $A_j = B(y, a2^j)$, $j = 0, 1, 2, 3, \dots$

We can express $\int_{B(y, a)} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx$

$$\begin{aligned} &= \sum_{i=0}^{\infty} \int_{A_i \setminus A_{i+1}} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx \\ &\leq \sum_{i=0}^{\infty} \left(\frac{a}{2^{i+1}} \right)^{\alpha-d} \int_{A_i} |f(x)| dx \\ &= \Omega_d \sum_{i=0}^{\infty} \left(\frac{1}{2} \right)^{\alpha-d} \left(\frac{a}{2^i} \right)^{\alpha} \frac{1}{\Omega_d} \left(\frac{a}{2^i} \right)^{-d} \int_{A_i} |f(x)| dx \\ &= \Omega_d \sum_{i=0}^{\infty} \left(\frac{1}{2} \right)^{\alpha-d} \left(\frac{a}{2^i} \right)^{\alpha} \frac{1}{|A_i|} \int_{A_i} |f(x)| dx \\ &\leq cMf(y) a^{\alpha} \sum_{i=0}^{\infty} \left(\frac{1}{2^{\alpha}} \right)^i \end{aligned}$$

Thus,

$$\int_{B(y, a)} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx \leq ca^{\alpha} Mf(y) \quad (9)$$

Or $I_{\alpha} f(y) \leq ca^{\alpha} Mf(y)$

This implies clearly our objective about lemma 5.

With the strong basis of above work and some important results we are going to extend our work toward the main result for sobolev inequality for Riesz potential.

Theorem 1: For $p > 1$ and $\alpha > 0$ there exists $c =$

$c(d, p, \alpha)$, such that for all $f \in L^p(R^d)$

We have $\|I_\alpha f\|_{L^{p^*}(R^d)} \leq c \|f\|_{L^p(R^d)}$,

Where $\alpha p < d$, and $p^* = \frac{pd}{d-\alpha p}$

Proof: Observe that the claim is exactly right for $f = 0$

Consider $f \neq 0$ on a set of positive measure, it is obvious that $Mf > 0$ everywhere then

$$\int_{R^d \setminus B(y, a)} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx \leq \left(\int_{R^d \setminus B(y, a)} |f(x)|^p dx \right)^{\frac{1}{p}} \left(\int_{R^d \setminus B(y, a)} |y-x|^{(\alpha-d)p'} dx \right)^{\frac{1}{p'}} \quad (10)$$

We can compute one part of product on right side as

$$\begin{aligned} \int_{R^d \setminus B(y, a)} |y-x|^{(\alpha-d)p'} dx &= \int_a^\infty \int_{\partial B(y, \varphi)} |y-x|^{(\alpha-d)p'} dS(x) d\varphi \\ &= \int_a^\infty \varphi^{(\alpha-d)p'} \int_{\partial B(y, \varphi)} 1 dS(x) d\varphi \end{aligned}$$

Since $\int_{\partial B(y, \varphi)} 1 dS(x) d\varphi = \omega_{d-1} \varphi^{d-1}$, above inequality can be reduced as

$$\begin{aligned} \int_{R^d \setminus B(y, a)} |y-x|^{(\alpha-d)p'} dx &= \omega_{d-1} \int_a^\infty \varphi^{(\alpha-d)p' + d-1} d\varphi \\ \text{Taking integral} &= \frac{\omega_{d-1}}{(\alpha-d)p' - d} a^{d-(d-\alpha)p'} \quad (11) \end{aligned}$$

exponent in (11) can be expressed in the form

$$\begin{aligned} d - (d-\alpha)p' &= d - (d-\alpha) \frac{p}{p-1} \\ &= \frac{\alpha p - d}{p-1} \end{aligned}$$

(11) implies,

$$\int_{R^d \setminus B(y, a)} |y-x|^{(\alpha-d)p'} dx = \frac{\omega_{d-1}}{(\alpha-d)p' - d} a^{\frac{\alpha p - d}{p-1}} \quad (12)$$

Applying (11), (10) can be rewritten as for any constant c ,

$$\int_{R^d \setminus B(y, a)} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx \leq c a^{\frac{\alpha p - d}{p-1}} \|f\|_{L^p(R^d)} \quad (13)$$

recalling lemma (5), we have $|I_\alpha f(y)| \leq \int_{R^d} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx$

$$\begin{aligned} &= \int_{B(y, a)} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx + \int_{R^d \setminus B(y, a)} \frac{|f(x)|}{|y-x|^{(d-\alpha)}} dx \\ &\leq c \left(a^\alpha Mf(y) + a^{\frac{\alpha p - d}{p-1}} \|f\|_{L^p(R^d)} \right) \end{aligned}$$

$$\text{Setting } a = \frac{Mf(y)}{\|f\|_{L^p(R^d)}^{\frac{p}{d}}},$$

we get

$$|I_\alpha f(y)| \leq c Mf(y)^{1-\frac{\alpha p}{d}} \|f\|_{L^p(R^d)}^{\frac{\alpha p}{d}} \quad (14)$$

Taking exponent $p^* = \frac{dp}{d-\alpha p}$ on both sides, we have

$$|I_\alpha f(y)|^{p^*} \leq c Mf(y)^p \|f\|_{L^p(R^d)}^{\frac{\alpha p}{d} p^*}$$

By lemma (1),

$$\int_{R^d} |I_\alpha f(y)|^{p^*} dx \leq c \|f\|_{L^p(R^d)}^{\frac{\alpha p}{d} p^*} \int_{R^d} Mf(y)^p dy$$

$$\leq c \|f\|_{L^p(R^d)}^{\frac{\alpha p}{d} p^*} \|Mf\|_{L^p(R^d)}^p$$

$$\leq c \|f\|_{L^p(R^d)}^{\frac{\alpha p}{d} p^*} \|f\|_{L^p(R^d)}^p$$

$$\text{Hence, } \|I_\alpha f\|_{L^{p^*}(R^d)} \leq c \|f\|_{L^p(R^d)}^{\frac{\alpha p}{d} + \frac{p}{p^*}}$$

$$\leq c \|f\|_{L^p(R^d)}$$

Here $p^* = \frac{pd}{d-\alpha p}$ is the Sobolev conjugate if $\alpha = 1$. Also, for $p = 1$ we can produce weak type estimates.

From (14), for $p = 1$ there exist $c = c(d, \alpha)$ such that

$$|I_\alpha f(y)| \leq c Mf(y)^{1-\frac{\alpha}{d}} \|f\|_{L^1(R^d)}^{\frac{\alpha}{d}}$$

taking maximal function approach for $p = 1$, we have

$$\begin{aligned} &|\{y \in R^d : |I_\alpha f(y)| > t\}| \\ &\leq \left| \left\{ y \in R^d : Mf(y) > c t^{\frac{d}{d-\alpha}} \|f\|_{L^1(R^d)}^{-\frac{\alpha}{d} \cdot \frac{d}{d-\alpha}} \right\} \right| \\ &\leq c t^{-\frac{d}{d-\alpha}} \|f\|_{L^1(R^d)}^{\frac{\alpha}{d-\alpha}} \|f\|_{L^1(R^d)} \end{aligned}$$

$$\text{Hence } |\{y \in R^d : |I_\alpha f(y)| > t\}| \leq c t^{-\frac{d}{d-\alpha}} \|f\|_{L^1(R^d)}^{\frac{\alpha}{d-\alpha}}$$

This can also give for every $t > 0$,

$$|\{y \in R^d : |I_\alpha f(y)| \geq t\}| \leq c t^{-\frac{d}{d-\alpha}} \|f\|_{L^1(R^d)}^{\frac{\alpha}{d-\alpha}} \quad (15)$$

It will help us to deduce the proof Sobolev Gagliardo-Nirenberg Inequality.

2. Main Result

Theorem 2: For every, $v \in C_0^1(R^d)$, if $1 \leq p < d$, there exist $c = c(d, p)$ such that

$$\|v\|_{L^{p^*}(R^d)} \leq c \|Dv\|_{L^p(R^d)}, \quad p^* = \frac{pd}{d-p}$$

Proof:

We will split the proof into two cases.

Case I: First we will take the case for $p > 1$

For every, $y \in R^d$, we can write from (1.7),

$$\|v(y)\| \leq \frac{1}{\omega_{d-1}} I_1(|Dv|)(y) \text{ where } 1 < p < d$$

Changing the inequality for $L^{p^*}(R^d)$,

$$\|v\|_{L^{p^*}(R^d)} \leq c \|I_1(|Dv|)\|_{L^{p^*}(R^d)}$$

By using above theorem (6) for $\alpha = 1$, we can write

$$\|v\|_{L^{p^*}(R^d)} \leq c \|Dv\|_{L^p(R^d)}$$

This is the required inequality for $p > 1$

Case II: For $p = 1$, let we consider pairwise disjoint sets like

$$B_i = \{y \in R^d : 2^i < |v(y)| \leq 2^{i+1}\}, i \in Z$$

Suppose $\varphi: R \rightarrow R$, $\varphi(t) = \max\{0, \min\{t, 1\}\}$, be an auxiliary function and $v_i: R^d \rightarrow [0, 1]$,

$$\begin{aligned} v_i(x) &= \varphi(2^{1-i}|v(y)| - 1) \\ &= \begin{cases} 0, & |v(y)| \leq 2^{i-1} \\ 2^{1-i}|v(y)| - 1, & 2^{i-1} < |v(y)| \leq 2^i \\ 1, & |v(y)| > 2^i \end{cases} \end{aligned}$$

Using lemma, if $v_i \in W^{1,1}(R^d)$, and $i \in Z$ then $Dv_i = 0$ almost a.e. in $R^d \setminus B_{i-1}$.

We can write, $|B_i| \leq |\{y \in R^d : |v(y)| \leq 2^i\}|$ if $|v(y)| \leq 2^i$ it implies that $2^{1-i}|v(y)| - 1 > 1$, above result can be written as

$$\begin{aligned} |B_i| &= |\{y \in R^d : v_i(y) = 1\}| \\ &\leq |\{y \in R^d : I_1(|Dv_i|)(y) \geq \omega_{d-1}\}|, \text{ by applying} \\ &\leq c \left(\int_{R^d} |Dv_i(y)| dy \right)^{\frac{d}{d-1}}, \text{ by applying (15)} \\ &\leq c \left(\int_{B_{i-1}} |Dv_i(y)| dy \right)^{\frac{d}{d-1}} \\ &\leq c \left(\int_{B_{i-1}} \varphi'(2^{1-i}|v(y)| - 1) 2^{1-i} |Dv(y)| dy \right)^{\frac{d}{d-1}} \\ &\leq c 2^{-i \frac{d}{d-1}} \left(\int_{B_{i-1}} |Dv(y)| dy \right)^{\frac{d}{d-1}} \end{aligned}$$

Applying summation for $i \in Z$, we get

$$\begin{aligned} \int_{R^d} |v(y)|^{\frac{d}{d-1}} &= \sum_{i \in Z} \int_{B_i} |v(y)|^{\frac{d}{d-1}} dy \\ &\leq \sum_{i \in Z} 2^{(i+1) \frac{d}{d-1}} |B_i| \\ &\leq c \sum_{i \in Z} \left(\int_{B_{i-1}} |Dv(y)| dy \right)^{\frac{d}{d-1}} \\ &\leq c \left(\sum_{i \in Z} \int_{B_{i-1}} |Dv(y)| dy \right)^{\frac{d}{d-1}} \end{aligned}$$

$$\text{Hence } \int_{R^d} |v(y)|^{\frac{d}{d-1}} \leq c \left(\int_{R^d} |Dv(y)| dy \right)^{\frac{d}{d-1}}$$

3. Remark

By considering the fact that $C_1^0(R^d)$ is dense in $W^{1,p}(R^d)$ then for $v \in W^{1,p}(R^d)$, the Sobolov-Gagliardo-Nirenberg inequality follows from the above theorem where $1 \leq p < n$.
